

This is NOT an exercise sheet, but is just a selection of exercises meant to be discussed at the blackboard during a “traditional” seminar.

Compact operators

Exercise 1. Let X be a normed space, let $f \in X^* \setminus \{0\}$, and let $X_0 = \text{Ker } f$. Show that there exists a 0-perpendicular to X_0 in X iff f is norm-attaining (which means that there exists $x \in X$, $\|x\| = 1$, such that $|f(x)| = \|f\|$). Give an example showing that this is not always the case.

Exercise 2. (a) Prove that a subset $S \subset c_0$ is relatively compact iff there exists $y \in c_0$ such that $|x_n| \leq |y_n|$ for all $x \in S$ and all $n \in \mathbb{N}$. (b) Does a similar result hold for ℓ^p ?

Exercise 3. Are the left and right shift operators on ℓ^p and on c_0 compact?

Exercise 4. Can the image of a compact operator between Banach spaces contain an infinite-dimensional closed vector subspace?

Exercise 5. Prove that the inclusion $C^1[a, b] \rightarrow C[a, b]$ is a compact operator.

Exercise 6. Let $I \subset \mathbb{R}$ be an interval (not necessarily open or closed, not necessarily bounded), let $f: I \rightarrow \mathbb{C}$ be an essentially bounded measurable function, and let M_f denote the respective multiplication operator on $L^p(I)$ ($1 \leq p \leq \infty$). Find a condition on f that is necessary and sufficient for M_f to be compact.

Exercise 7. Given an integrable function f on $[0, 1]$, define a function Tf on $[0, 1]$ by

$$(Tf)(x) = \int_0^x f(t) dt.$$

Is T a compact operator (a) from $C[0, 1]$ to $C[0, 1]$? (b) from $L^p[0, 1]$ to $C[0, 1]$ (where $1 < p \leq \infty$)? (c) from $L^p[0, 1]$ to $L^p[0, 1]$ (where $1 < p \leq \infty$)? (d) from $L^1[0, 1]$ to $C[0, 1]$? (e) from $L^1[0, 1]$ to $L^1[0, 1]$?

Exercise 8. Let $I = [a, b]$, and let $K \in C(I \times I)$. Prove that the integral operator $T: C(I) \rightarrow C(I)$,

$$(Tf)(x) = \int_a^b K(x, y)f(y) dy,$$

is compact.

Exercise 9. Let (X, μ) be a measure space, and let $K \in L^2(X \times X, \mu \times \mu)$. Prove that the Hilbert–Schmidt integral operator $T_K: L^2(X, \mu) \rightarrow L^2(X, \mu)$,

$$(T_K f)(x) = \int_X K(x, y)f(y) d\mu(y),$$

is compact.

Hint: show that functions of the form $K(x, y) = f(x)g(y)$, where $f, g \in L^2(X, \mu)$, span a dense subspace of $L^2(X \times X, \mu \times \mu)$, and use the fact that $\|T_K\| \leq \|K\|_2$ (see Exercise 2.8).

Exercise 10. (a) Let X be a compact metrizable topological space, let $K \in C(X \times X)$, and let μ be a finite Borel measure on X . Show that the image of the Hilbert–Schmidt integral operator $T_K: L^2(X, \mu) \rightarrow L^2(X, \mu)$ is contained in $C(X)$, and that T_K is a compact operator from $L^2(X, \mu)$ to $C(X)$.

(b)-B Extend (a) to an arbitrary (not necessarily metrizable) compact topological space X .

Exercise 11. Calculate the norm of the operator $T: L^2[0, 1] \rightarrow L^2[0, 1]$ defined in Exercise 7.

Hint: T^*T is compact and selfadjoint.
