## Free compact quantum groups

(EXERCISES FOR LECTURE 15)

**Definition 7.1.** Let A be a unital  $C^*$ -algebra. An element  $u \in M_n(A)$  is

- (i) biunitary if u and  $\bar{u}$  are unitary (where  $(\bar{u})_{ij} = u_{ij}^*$  for all i, j);
- (ii) orthogonal if u is invertible,  $\bar{u} = u$ , and  $u^{-1} = u^{\top}$  (where  $u^{\top}$  is the transpose of u); (iii) magic unitary if each  $u_{ij}$  is an orthogonal projection, and  $\sum_j u_{ij} = \sum_k u_{k\ell} = 1$  for all  $i, \ell$ .

**7.1.** Let A be a C<sup>\*</sup>-algebra, and let  $p_1, \ldots, p_n \in A$  be orthogonal projections such that  $\sum_i p_i$  is an orthogonal projection. Show that the  $p_i$ 's are pairwise orthogonal (i.e.,  $p_i p_j = 0$  for all  $i \neq j$ ). Deduce that, if  $u \in M_n(A)$  is a magic unitary, then the projections in each row and in each column of u are pairwise orthogonal.

**7.2.** Let A be a unital  $C^*$ -algebra.

- (a) Show that each magic unitary in  $M_n(A)$  is orthogonal, and that each orthogonal is biunitary.
- (b) Show that, if A is commutative, then  $a \mapsto \overline{a}$  is a  $\mathbb{C}$ -antilinear \*-automorphism of  $M_n(A)$ . Deduce that each unitary in  $M_n(A)$  is biunitary.
- (c) Construct a unital C<sup>\*</sup>-algebra A and a unitary  $u \in M_2(A)$  that is not a biunitary.

7.3. Show that

(a) 
$$C(U(n)) \cong C^*_{\text{com}}\left(u_{ij}, 1 \leqslant i, j \leqslant n \mid u = (u_{ij}) \text{ is biunitary}\right);$$

(b) 
$$C(O(n)) \cong C^*_{\text{com}}(u_{ij}, 1 \le i, j \le n \mid u = (u_{ij}) \text{ is orthogonal});$$

(c)  $C(S_n) \cong C^*_{\text{com}}(u_{ij}, 1 \le i, j \le n \mid u = (u_{ij}) \text{ is a magic unitary}).$ 

Here  $C^*_{\rm com}(\cdots)$  stands for the universal commutative unital C\*-algebra with prescribed generators and relations.

**7.4.** The free unitary quantum group  $C^+(U(n))$  is defined by

$$C^+(U(n)) = C^*\left(u_{ij}, 1 \le i, j \le n \mid u = (u_{ij}) \text{ is biunitary}\right).$$

Show that there exists a unique comultiplication  $\Delta : C^+(U(n)) \to C^+(U(n)) \otimes_* C^+(U(n))$  such that  $(C^+(U(n)), \Delta, u)$  is a compact matrix quantum group.

**7.5.** The free orthogonal quantum group  $C^+(O(n))$  is defined by

$$C^+(O(n)) = C^*\left(u_{ij}, 1 \le i, j \le n \mid u = (u_{ij}) \text{ is orthogonal}\right).$$

Show that there exists a unique comultiplication  $\Delta : C^+(O(n)) \to C^+(O(n)) \otimes_* C^+(O(n))$  such that  $(C^+(O(n)), \Delta, u)$  is a compact matrix quantum group.

**7.6.** The free quantum permutation group  $C^+(S_n)$  is defined by

$$C^+(S_n) = C^* \Big( u_{ij}, 1 \leq i, j \leq n \Big| u = (u_{ij}) \text{ is a magic unitary} \Big).$$

Show that there exists a unique comultiplication  $\Delta: C^+(S_n) \to C^+(S_n) \otimes_* C^+(S_n)$  such that  $(C^+(S_n), \Delta, u)$  is a compact matrix quantum group.

Exercise 7.3 implies that we have canonical surjective morphisms of compact quantum groups  $C^+(U(n)) \to C(U(n)), C^+(O(n)) \to C(O(n)), \text{ and } C^+(S_n) \to C(S_n).$ 

**7.7.** Let  $F_n$  denote the free group on n generators. Show that there exists a surjective morphism  $C^+(U(n)) \to C^*(F_n)$  of compact quantum groups. Deduce that  $C^+(U(n))$  is noncommutative for  $n \ge 2$ .

**7.8.** Let  $L_n$  denote the free product of n copies of  $\mathbb{Z}/2\mathbb{Z}$ . Show that there exists a surjective morphism  $C^+(O(n)) \to C^*(L_n)$  of compact quantum groups. Deduce that  $C^+(O(n))$  is noncommutative for  $n \ge 2$ .

**7.9.** Show that the canonical morphism  $C^+(S_2) \to C(S_2)$  is an isomorphism.

**7.10.** Show that  $C^+(S_n)$  is noncommutative and infinite-dimensional for  $n \ge 4$ . As a corollary,  $C^+(S_n) \to C(S_n)$  is not an isomorphism.

*Hint:* for any pair p, q of orthogonal projections, the matrix

$$\begin{pmatrix} p & 1-p & 0 & 0\\ 1-p & p & 0 & 0\\ 0 & 0 & q & 1-q\\ 0 & 0 & 1-q & q \end{pmatrix}$$

is a magic unitary.
